VacciCheck®

Is My Puppy or Kitten Protected? A Simple Guide with VacciCheck®

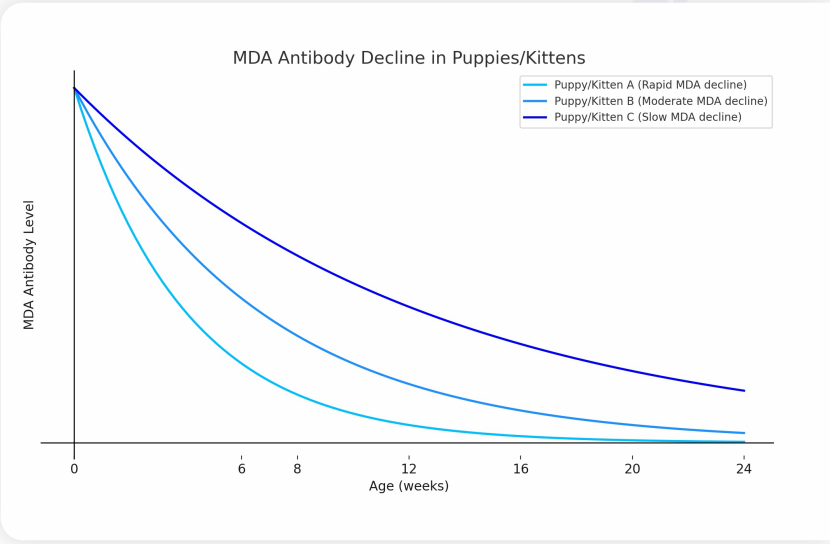
What are MDAs (Maternally Derived Antibodies)?

Passed from mother
Puppies and kittens receive MDAs through their mother's colostrum shortly after birth.

Vaccine interference
As long as MDAs are present, they neutralize vaccines, making them ineffective.

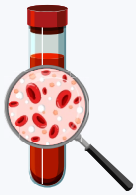
Temporary protection
These antibodies can disappear in a few weeks or persist up to 20 weeks or more.

Why boosters are given
Vaccines are repeated to catch the right moment, when MDAs are gone and vaccines can work.



What is VacciCheck®?

A quick blood test to measure antibody levels → confirming protection and identifying the right time for vaccination as maternal antibodies decline



What Does VacciCheck® Test For?

Dogs
- Parvovirus
- Distemper virus
- Adenovirus

Cats
- Panleukopenia virus
- Herpesvirus
- Calicivirus

How Can VacciCheck® be Used?

After vaccination series
Confirm your puppy/kitten is protected- relax and socialize them without worry.

Before vaccination
Check MDA levels to vaccinate at the right moment for maximum effectiveness.
